

Tepmetko (Tepotinib), Film coated tablets

רופא/ה, רוקח/ת וצוות רפואי נכבדים,

אנו מבקשים להודיעכם כי העלון לרופא והעלון לצרכן של התכשיר Tepmetko אנו מבקשים

ההתוויה המאושרת:

TEPMETKO is indicated for the treatment of adult patients with metastatic non-small cell lung cancer (NSCLC) harbouring a MET tyrosine kinase receptor exon 14 (METex14) skipping mutation.

<u>השינויים בעלון לרופא הינם (</u>טקסט שנוסף מופיע עם <u>קו תחתון,</u> טקסט שנמחק מופיע עם קו חוצה):

Special dosage instructions-Elderly patients

No dose adjustment is necessary in patients aged 65 years and above (see section Pharmacokinetics). Of 313 255 patients with METex14 skipping alterations in the VISION study, 79% were 65 years or older, and 8% were 85 years or older.

Mode of administration

Administration to patient who have difficulty swallowing solids

If the patient is unable to swallow, the tablets can be dispersed in 30 mL of non-carbonated water. No other liquids should be used or added. Drop the tablets in a glass with water without crushing, stir until the tablets dispersed into small pieces (the tablet will not completely dissolve) and swallow the dispersion immediately together with food. Rinse with additional 30 mL to ensure that no residues remain in the glass and drink immediately.

If an administration via a naso-gastric tube (with at least 8 French gauge) is required, disperse the tablets in 30 mL of non-carbonated water as described above. Administer the 30 mL of dispersion immediately together with food as bolus as per naso-gastric tube manufacturer's instructions. Immediately rinse twice with 30 mL of non-carbonated water each to ensure that no residues remain in the syringe.

Warnings and precautions Hepatotoxicity

Increases in alanine aminotransferase (ALT) and aspartate aminotransferase (AST) have been reported (see section Undesirable effects). One fatal event of acute liver failure has occurred. Liver enzymes (including ALT, AST and bilirubin) should be monitored prior to initiation of treatment with

Merck Serono Ltd.

18 Kishon St. Yavne, Israel 81220 Tel: +972 8 9382610 Fax: +972 8 9403152 office.israel@merckgroup.com 1 of 6

Tepmetko, then every two weeks during the first three months of treatment and then once monthly or as clinically indicated. in patients found to have elevated transaminases or bilirubin levels, more frequently tests should be performed. Depending on severity of adverse drug reactions, Tepmetko must be temporarily discontinued, the dose reduced or discontinued permanently (see section Dosage/Administration).

Undesirable effects

Summary of the safety profile

The safety profile of Tepmetko reflects exposure to tepotinib in $\underline{506}$ 448 patients with various solid tumours enrolled in five open-label, single-arm studies, in which patients received tepotinib as a single agent at a dose of 450 mg once daily. This includes $\underline{313}$ 255 patients with advanced NSCLC harbouring METex14 skipping alterations included in the main clinical study (VISION).

The most common adverse reactions observed in the main clinical study (VISION) were oedema (80.2% 69.0%) of patients), mainly peripheral oedema (72.5% 60.0%), nausea (31% 26.7%), diarrhoea (28.8% 26.3%), increase in creatinine (30.4% 25.9%), hypoalbuminaemia (33.9% 23.9%) and fatigue (15.7%). Most common serious adverse reactions were reported for generalised oedema (1.9% 2.0%) and peripheral oedema (3.2% 2.4%).

Peripheral oedema was the most frequent cause of permanent treatment discontinuation ($\underline{5.4\%}$), temporary treatment discontinuation ($\underline{19.8\%}$) or dose reduction ($\underline{15.7\%}$).

- * ILD as per Integrated Assessment
- a includes terms hypoalbuminaemia, blood albumin decreased
- b includes terms dyspnoea, dyspnoea at rest, exertional dyspnoea
- c includes terms interstitial lung disease, pneumonitis, acute respiratory failure, lung fibrosis and radiation pneumonitis
- d includes terms amylase increased, hyperamylasaemia
- e includes terms lipase increased, hyperlipasaemia
- f includes terms blood creatinine increased, hypercreatinaemia
- g includes terms oedema peripheral, oedema, oedema genital, face oedema, localised oedema, periorbital oedema, peripheral swelling, scrotal oedema

Description of selected adverse reactions Interstitial lung disease/pneumonitis

Interstitial lung disease (ILD) or ILD-like adverse reactions have been reported in $\underline{8}$ $\underline{6}$ patients ($\underline{2.6\%}$ $\underline{2.4\%}$) with advanced NSCLC with METex14 skipping alterations who received tepotinib monotherapy at the recommended dosage regimen (n= $\underline{313}$ $\underline{255}$), including 1 case of grade 3 or higher; serious cases occurred in $\underline{4}$ 2 patients ($\underline{1.3\%}$ $\underline{0.8\%}$), 1 case was fatal (see sections Dosage/Administration and Warnings and precautions).

Hepatoxicity

Hepatotoxicity has occurred in patients treated with Tepmetko. In the main clinical study, <u>an increase of at least 1 grade was observed for 49.5% of patients for ALT and 39.9% of patients for AST. An increase to grade 3 or higher occurred in 4.9% of patients for ALT and 3.6% of patients for <u>AST ALT/AST elevations occurred in 12.2% of patients. In 3.1% of patients, an increase in ALT/AST to grade 3 or higher was observed. In one patient, a fatal case of liver failure occurred. No patients treated with Tepmetko discontinued treatment due to elevated ALT/AST. The median time to onset of an elevated ALT/AST increase to grade 3 or higher was <u>9.9</u> 7.3 weeks (<u>time</u> range 3.1 to <u>37.4</u> 8.6 weeks) (see sections Dosage/Administration and Warnings and precautions).</u></u>

ALP increase did not lead to any dose reductions, temporary discontinuation, or permanent discontinuation. The observed ALP increase was not associated with cholestasis. Based on laboratory values, a worst-on-treatment increase of at least 1 grade was observed for 51.6% 47.5% of patients for ALP in the main clinical study. An increase to grade 3 or higher occurred in 1.6% of patients.

Increase in creatinine

Based on laboratory values, shifts of at least 1 grade in creatinine were documented for 59.9% 52.9% of patients in the main clinical study; three one patients had a shift to a grade 3 creatinine increase. A median increase in serum creatinine of 30% 31% was observed 21 days after initiation of treatment with Tepmetko. The serum creatinine increases persisted throughout treatment and were reversible upon treatment completion (see section Warnings and precautions).

Increase in amylase or lipase

Increases in amylase or lipase were generally asymptomatic and not associated with pancreatitis and could be managed without dose reduction.

Based on laboratory values, - an increase of at least 1 grade was observed for $\underline{24.9\%}$ 21.6% of patients for amylase and $\underline{21.2\%}$ 17.3% of patients for lipase in the main clinical study. An increase to grade 3 or higher occurred in $\underline{5.3\%}$ 4.3% of patients for amylase and $\underline{5.3\%}$ 3.5% of patients for lipase.

QTc prolongation

In the main clinical study (patients with METex14 skipping alterations, n= $\underline{313}$ $\underline{255}$); QTcF prolonged to > 500 ms was observed in $\underline{8}$ $\underline{6}$ patients ($\underline{2.6\%}$ $\underline{2.4\%}$) and QTcF prolonged by at least 60 ms from baseline in $\underline{19}$ $\underline{12}$ patients ($\underline{6.1\%}$ $\underline{4.7\%}$) (see section Warnings and precautions). The findings were isolated and asymptomatic, the clinical significance is unknown. In an exposure-response QTc analysis, no significant changes in the QTc interval (> 20 ms) were found on average at the therapeutic dose, but a concentration-dependent prolongation was found (see section Properties/Effects, Cardiac electrophysiology).

Clinical efficacy

The efficacy of tepotinib was evaluated in a single-arm, open-label, multicentre study (VISION) in adult patients with locally advanced or metastatic non-small cell lung cancer (NSCLC) harbouring METex14 skipping alterations (n=313 152). Patients had an Eastern Cooperative Oncology Group Performance Status (ECOG PS) of 0 or 1 and were either treatment-naïve or had progressed on up to 2 lines prior systemic therapies. Neurologically stable patients with central nervous system metastases were permitted. Patients with epidermal growth factor receptor (EGFR) or anaplastic lymphoma kinase (ALK) activating alterations were excluded.

The primary efficacy outcome measure was confirmed objective response (complete response or partial response, ORR) according to Response Evaluation Criteria in Solid Tumors (RECIST v1.1) as evaluated by an Independent Review Committee (IRC). Additional efficacy outcome measures included complete response, partial response, duration of response (DOR) and progression-free survival (PFS), assessed by IRC, as well as overall survival (OS).

Patients had a median age of 72 73 years (range 41 to 94), 51% 48% were female and 49% 52% male. The majority of patients were white (62% 71%), followed by Asian patients (34% 25%) and were never (49% 43%) or former smokers (45% 50%). Most patients were \ge 65 years of age (79% 82%) and 41% 45% of patients were \ge 75 years of age.

The majority of patients had stage IV disease (94%), 81% 86% had adenocarcinoma histology. Thirteen Ten percent of the patients had stable brain metastases. Patients received tepotinib as first-line (52% 45%) or second- or later line (48% 55%) therapy.

METex14 skipping alterations were prospectively tested by next-generation sequencing in tumour (RNA-based) and/or plasma (ctDNA-based).

Patients received 450 mg tepotinib once daily until disease progression or unacceptable toxicity. Median treatment duration was 7.5 + 7.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 = 0.03 =

In the initial efficacy analysis 152 adult patients with locally advanced or metastatic NSCLC harbouring METex14 skipping alterations with a follow up of at least 9 months were evaluated (see Table 3). The primary efficacy outcome measure was confirmed objective response (complete

response or partial response) according to Response Evaluation Criteria in Solid Tumors (RECIST v1.1) as evaluated by an Independent Review Committee (IRC). Additional efficacy outcome measures included complete response, partial response, duration of response and progression-free survival assessed by IRC as well as overall survival.

In an extended efficacy analysis additional 161 adult patients with locally advanced or metastatic NSCLC harbouring METex14 skipping alterations were enrolled into the VISION study. Overall, efficacy results refer to 313 patients with a follow up of at least 18 months.

In the overall population of 313 patients, 161 patients showed either a partial (n = 160) or a complete (n = 1) response, resulting in an ORR of 51.4% (95%-Cl 45.8, 57.1%). A median DOR of 18.0 months (95%-Cl 12.4, 46.4 months) is observed, with 65.8%, 49.7%, and 38.5% out of 161 patients still showing continued response after 6, 9 or 12 months, respectively. A median PFS of 11.2 months (95%-Cl 9.5, 13.8 months) and a median OS of 19.6 months (95%-Cl 16.2, 22.9 months) was observed.

In 164 treatment naive patients, 94 patients showed either a partial (n = 93) or a complete (n = 1) response resulting in an ORR of 57.3% (95%-Cl 49.4, 65.0%). A median DOR of 46.4 months (95%-Cl 13.8, ne months) is observed, with 66.0%, 51.1%, and 40.4% out of 94 patients still showing continued response after 6, 9 or 12 months, respectively. A median PFS of 12.6 months (95%-Cl 9.7, 17.7 months) and a median OS of 21.3 months (95%-Cl 14.2, 25.9 months) was observed.

In 149 previously treated patients, 67 patients showed a partial response resulting in an ORR of 45.0% (95%-CI 36.8, 53.3%). A median DOR of 12.6 months (95%-CI 9.5, 18.5 months) is observed, with 65.7%, 47.8%, and 35.8% out of 67 patients still showing continued response after 6, 9 or 12 months, respectively. A median PFS of 11.0 months (95%-CI 8.2, 13.7 months) and a median OS of 19.3 months (95%-CI 15.6, 22.3 months) was observed.
